We've finally reached the end of the [Price Action Masterclass](). We'll wrap up with explaining how to use price action to help with trade management:

[Exits]() — One of the biggest edges you can have in your trade management optimizing how you exit a trade. This lecture explores all different types of exit strategies for losing trades and winning ones.

[Probability Mutation]() — The location of your stops and targets have a much higher influence on your win rate than anything else. Quantifying and understanding the theoretical breakeven rate on a trade setup will give you a ballpark estimate of a trade's probability of success. Armed with this knowledge, you can tweak your system to fit your emotional needs.

[Bayesian Inference]() — Successful investing involves making adjustments and tweaks to existing trades as new information becomes available. This process is called Bayesian Inference. This lecture will teach you how to apply this advanced technique to your trading.

Your Macro Operator,

Alex
